

Statement of Purpose for Senior Data Journalist Role

Technology reporting today suffers from a familiar problem: an abundance of opinions and a scarcity of evidence. My purpose as a data journalist is to correct that imbalance systematically, and compellingly.

Whether examining venture capital flows, fintech adoption curves, or workforce contractions in the tech sector, I approach datasets not as static tables but as dynamic narratives waiting to be decoded. My work sits at the intersection of data science and editorial clarity where statistical rigour meets storytelling precision.

With a professional foundation spanning data analysis, research, and business intelligence, I have developed a workflow that moves seamlessly from data acquisition to insight delivery. I scrape and structure complex datasets using Python and SQL, interrogate them through exploratory and inferential analysis, and translate findings into clear, visually engaging outputs dashboards, charts, and interactive assets that do more than inform; they provoke understanding. Tools such as Tableau, Excel, and programmatic visualisation frameworks enable me to present data in ways that are both analytically sound and editorially impactful.

However, technical capability alone is insufficient in journalism. What distinguishes effective data storytelling is judgment, the ability to identify which signals matter, which anomalies are meaningful, and which narratives deserve amplification. My orientation toward emerging markets, particularly within Africa's tech ecosystem, allows me to contextualise numbers within broader economic, regulatory, and behavioural realities. I do not just report trends; I interrogate their implications.

At Techloy, I see an opportunity to contribute to a newsroom that values depth over noise and clarity over clutter. The mandate to uncover hidden patterns in venture activity, startup valuations, and industry shifts aligns directly with my analytical instincts and professional trajectory.

Ultimately, my goal is not just to analyse data but to shape conversations. To produce work that becomes reference material. To transform raw datasets into narratives that decision-makers, founders, and analysts rely on.

Badawi Aminu Muhammed.
